# Report Title in Sentence Case

*An optional subtitle giving the scope or the claim*

**First A. Author*, Second B. Author, Third C. Author†**

Centre of Excellence for Data Science, Artificial Intelligence and Modelling (DAIM), University of Hull, United Kingdom

*Corresponding author. †Also at Department Name, Institution Name.

**State the problem in one or two sentences, then say what this report contributes. Summarise the approach without method detail, give the headline result with a number if you have one, and close with what follows from it. The abstract carries no heading and is set in bold across the full measure, so keep it to a single paragraph. Readers who go no further should still come away knowing what was done and what it means.**

**Keywords:** first keyword; second keyword; third keyword; fourth keyword

## 1. Introduction

Open with the problem and why it matters, in prose rather than bullets. Cite as you go: parenthetically with (Author and Coauthor, 2025), or in the running text as Author (2023) showed. Multiple sources go in one call, (Author and Coauthor, 2025, 2024), so that they collapse into a single parenthesis.

Paragraphs are indented and carry no extra vertical space between them, which is the convention this layout follows. Use a footnote for an aside that would otherwise interrupt the argument.[1]

State the contribution explicitly. A short list is appropriate here even though the surrounding text is prose:

1. **First contribution.** One sentence saying what is new and what it enables.
2. **Second contribution.** Another sentence in the same shape.
3. **Third contribution.** And a third, if there is one.

Use a key box sparingly — once or twice in a report — for the claim you most want a skimming reader to take away.

**Headline finding**

State the single most important result or position here, in two or three sentences. This panel is deliberately conspicuous, so it loses its force if it appears on every page.

### 1.1 Scope

Say what the report does and does not cover, and how it relates to adjacent work. Second-level headings are numbered and unpunctuated.

[1] Footnotes are set small below a short rule. Keep them rare; anything load-bearing belongs in the body or an appendix.

Figure 1 | A one- or two-sentence caption that says what the reader should see, not merely what the axes are. The label and text are separated by a vertical bar, and the whole caption is centred.

| Condition | Metric A | Metric B | Notes |
|---|---|---|---|
| Baseline | 0.00 | 0.00 | Reference condition. |
| Variant one | 0.00 | 0.00 | One clause on what changed. |
| Variant two | 0.00 | 0.00 | One clause on what changed. |
| **Ours** | **0.00** | **0.00** | Bold the row you want read first. |

Table 1 | Caption below the table, saying what the comparison establishes. Define every abbreviation used in the header.

### 1.1.1 A third level, if the material needs it

Three levels are available. If you find yourself wanting a fourth, use a run-in paragraph heading instead.

**Run-in heading.** A bold run-in heading followed by a full stop, then the text on the same line. Good for naming a method, an assumption or a case without spending a numbered heading on it.

## 2. Method

Describe the approach in enough detail to be reproducible. Display mathematics is numbered and referenced by number, so that the text can point at it:

$$y = f(x;\theta) + \varepsilon, \qquad \varepsilon \sim \mathcal{N}(0, \sigma^2), \tag{1}$$

where $x$ is the input, $\theta$ the parameters and $\varepsilon$ the residual. Refer back with Equation (1) rather than repeating it.

Figures are centred, with the caption below and labelled for cross-reference. Replace the placeholder box below with `\includegraphics` or a TikZ picture; Figure 1 shows where it goes.

## 3. Results

Tables use `booktabs` rules with a tinted header row. Keep them free of vertical rules, and put the caption below the table.

Refer to floats by number — Table 1 and Figure 1 — never as “the table above”, since floats move.

Use the neutral grey panel for verbatim material: a transcript, a prompt, a worked example, a piece of a specification.

**Example transcript**

**Input:** The prompt, query or input case, quoted verbatim.

**Output:** The response or result, quoted verbatim and truncated with an ellipsis if it runs long.

*A short italic gloss on what the example demonstrates.*

## 4. Discussion

Interpret the results: what they support, what they do not, and where the approach breaks down. Be specific about limitations — a reader who finds them for you will trust the rest less. Reports and preprints cite the same way as anything else (Author, 2026).

## 5. Conclusion

Restate the contribution in a sentence, then say what should happen next. Avoid introducing new claims here.

## Acknowledgements

Funding, facilities and people who helped but are not authors. Name the grant and its number if there is one. Use `\daimsection` for headings that should appear in the contents but carry no number.

## References

First A. Author and Second B. Coauthor. Title of the journal article in sentence case. *Name of the Journal*, 12(3):101–118, 2025. doi: 10.0000/placeholder.

Fourth D. Author and Fifth E. Coauthor. Title of the conference paper. In *Proceedings of the Conference Name*, pages 1–12, 2024.

Sixth F. Author. Title of the technical report or preprint. Technical report, Institution Name, 2026. Available at https://example.org/report.

Third C. Author. *Title of the Book*. Publisher Name, City, 2 edition, 2023.

## Appendix A. Notation

Material that supports the argument but would interrupt it: notation, derivations, full parameter tables, extra results.

| Symbol | Meaning |
|---|---|
| $x$ | Input variable |
| $y$ | Observed response |
| $\theta$ | Model parameters |
| $\varepsilon$ | Residual term |

Table A1 | Notation used throughout the report.

## Appendix B. Additional results

A second appendix, if you need one.
